

Synopsis

The Event Management System is a web-based application developed to simplify the process of organizing, managing, and participating in events within an educational institution or organization. Traditional event management methods often rely on manual registrations, paper records, and multiple communication channels, making the process time-consuming and prone to errors. This project provides a centralized digital platform that enables administrators to create and manage events while allowing users to browse, register, and receive updates efficiently.

The application is developed using **React.js** for the frontend and **Firebase** as the backend platform. Firebase Authentication provides secure user login and registration, Cloud Firestore stores event and registration data in real time, and Firebase Storage manages event posters and related media. The system offers separate interfaces for administrators and users, ensuring proper access control and a seamless user experience.

The Event Management System improves operational efficiency, minimizes paperwork, enhances communication between organizers and participants, and provides accurate record management. Its responsive design allows users to access the platform from desktops, tablets, and mobile devices. The project demonstrates the practical application of modern web technologies in solving real-world event management challenges.
